

BIS workshops

The purpose of this series of one-day workshops hosted by ICUB-SVMP is to facilitate face to face interactions among researchers from different scientific disciplines who are involved in solving challenging research problems of broad biomedical, ecological or industrial interest.

Participants will include researchers from biological, medical, physical, chemical, bioinformatics, engineering faculties and institutes, as well as representatives of industrial partners.

We hope that these periodic meetings will foster cross-disciplinary collaboration and create the opportunity to develop joint research projects that could offer an interdisciplinary approach for critical research problems.

These workshops will also encourage and facilitate the networking of graduate, master, doctoral students and postdoctoral fellows with investigators from different fields of research.

Our research topics will include, but not limit to novel strategies to combat infectious diseases and cancer, inter-kingdom communication and signaling, biomaterials, biotechnologies, genomics/metagenomics, genetics, bioinformatics, statistics.
